please utilize the following information to contextualize the current research and outline for this app:

part one:
This is a massive but highly achievable vision. To replace a desktop computer entirely, your app cannot just be a "viewer"; it must be a full-featured "doer."
Since you are targeting trades (and based on your background in roofing), the app needs to handle high mobility, offline capabilities, and quick, thumb-friendly actions.
Here is the comprehensive feature breakdown for your "Pocket HQ", structured by the flow of business.
Phase 1: Intelligent Onboarding (The Setup)
The goal here is to pre-configure the app so the user doesn't stare at a blank screen. The "Tailoring" happens here.

1. Industry Selection (The Configurator)
   Input: "What is your trade?" (Roofing, HVAC, Plumbing, Landscaping, General Contracting).
   Action:
   If Roofing: Pre-loads measurement units (squares, linear feet), material lists (shingles, drip edge), and common service items (tear-off, install).
   If Plumbing: Pre-loads hourly rates, common parts (fittings, valves), and dispatch-heavy workflows.
   Outcome: The "Price Book" and "Service Menu" are 80% ready immediately.
2. Business DNA
   Input: Logo upload, company address, tax rates, standard labor rate, markup percentage.
   Outcome: All future PDFs (estimates, invoices) are instantly branded and calculated correctly.
3. Team Roles
   Input: "Do you have employees?" -> "Invite them."
   Outcome: Sets permissions. (Owner = Admin; Tech = View Schedule/Clock In only; Sales = View Leads/Estimates only).
   Phase 2: The Core Modules (Running the Business)
4. CRM & Lead Management (The Sales Engine)
   Universal Inbox: A single chat stream combining SMS, Email, and Google Business Messages for each client. Crucial for mobile.
   Lead Intake Forms: A customizable web form users can share. When a client fills it out, a "Lead Card" creates itself in the app.
   Pipeline Board: A Kanban view (New -> Contacted -> Estimate Sent -> Won -> Scheduled)

that users can swipe through.
"One-Tap" Actions: Call, Text, or Navigate to the lead with one thumb press.

5. Estimating & Proposals (The Money Maker)
   Tiered Options Generator: Allow the user to quickly build "Good, Better, Best" packages. (e.g., "3-Tab Shingle" vs. "Architectural" vs. "Designer").
   Visual Line Items: Add photos to line items. (e.g., A picture of the specific faucet or shingle being installed).
   Digital Signatures: The phone becomes the contract. The client signs with their finger directly on the screen.
   Dynamic Calculations: Change the "Square Footage" variable, and the labor/material price auto-updates across the whole quote.
6. Scheduling & Dispatch (The Logistics)
   Drag-and-Drop Calendar: View by Day, Week, or "Map View" (see where jobs are geographically).
   Job Status Notifications: When a tech taps "On My Way," the customer automatically gets an SMS with a tracking link or ETA.
   Resource Allocation: Prevent double-booking equipment (e.g., "Dump Trailer 1" is already booked for Tuesday).
7. Job Management & Field Ops (The Execution)
   Site Profile: A dedicated page for the job site containing gate codes, door photos, and specific instructions (e.g., "Beware of dog").
   Photo Documentation:
   Before: Force the crew to take photos before starting.
   During: Progress shots.
   After: Completion shots required to unlock the "Send Invoice" button.
   Time Tracking: Geo-fenced clock-in. The app knows when the employee arrives at the site.
   Change Order Management: If the scope changes (e.g., "Found rotten plywood"), the user can generate a "Change Order" on the spot for approval, rather than doing work for free.
8. Finance & Invoicing (The Collection)
   Instant Invoicing: Convert "Estimate" to "Invoice" with one tap.
   Mobile Payments: Tap-to-Pay (using the phone's NFC) or Stripe integration for credit cards.
   Expense Receipt Scanner: Take a photo of the Home Depot receipt; AI extracts the vendor, date, and amount and assigns it to the specific Job #.
   Profit Pulse: A simple dashboard showing "Job Costing" – (Quote Amount - Material Cost - Labor Cost = Actual Profit).
9. Reputation Management (The Growth)
   Auto-Review Request: The moment the invoice is paid, the app automatically texts the client: "Happy with your roof? Click here to leave a Google review."
   Referral Engine: A button to easily send a discount code to the happy client to share with neighbors.
   Phase 3: The "Mobile-First" Secret Weapons
   To truly run everything from a phone, you need features that desktop apps don't have.
10. Offline Mode (Sync-Later Architecture)
    The Problem: Tradesmen work in basements or rural areas with no signal.

The Solution: The app must work 100% offline (creating invoices, taking photos, clocking in). It syncs to the cloud the second signal returns.

11. Voice-to-Data
    Instead of typing notes with dirty thumbs, the user holds a button and says: "Job notes: Customer complained about a leak in the north valley. We need 3 bundles of hip and ridge."
    AI Action: Transcribes the note and adds "Hip and Ridge Shingles (3 bundles)" to the material order list automatically.
12. The "Morning Briefing"
    A push notification at 6:30 AM: "Good morning. You have 3 jobs today. First stop is 15 mins away. You are waiting on 2 payments totaling $4,500."
    Recommended Tech Stack (For a Solo Full-Stack Dev)
    Frontend: React Native (Expo) - Perfect for "write once, run everywhere" mobile/web.
    Backend: Supabase (PostgreSQL) - Handles the "Offline/Sync" complexity brilliantly with its realtime capabilities.
    Auth: Clerk or Supabase Auth.
    Payments: Stripe Connect.

This Pocket HQ / TradeLite concept is essentially a “mobile-first PSA + CRM” for trades, with onboarding and offline workflow as the real moat, not any single feature.[1]

Below is a concise contextualization of your current research and how it maps directly onto the Pocket HQ outline you just shared.

1. Vision: From Viewer to Doer

- Your research already positions this as a **Vertical B2B Micro-SaaS** for trades (roofing, masonry, landscaping, pools, etc.) that replaces paper, spreadsheets, and overbuilt tools like Projul/Jobber with a lean, workflow-centric app.[1]
- Both the Pocket HQ spec and the TradeLite spec converge on the same core loop: Lead → Estimate → Scheduled Job → Field Execution → Invoice → Review/Retention, all driven from a phone with minimal taps and strong offline behavior.[1]

2. Intelligent Onboarding = Zero-Friction Wizard

Pocket HQ Phase 1 (“Configurator” + “Business DNA” + “Team Roles”) lines up almost one-to-one with the Zero-Friction Onboarding Wizard and “Trade-Lock” you already defined.[1]

- **Trade selection & templates**
  - You already designed a `masterservicelibrary` with `tradetags` and an onboarding multi-select grid (Roofing, Masonry, Landscaping, Pool Maint, etc.).[1]
  - Pocket HQ’s “Industry Selection” → Pre-load units, materials, and services is exactly what your Trade Template Engine does: on sign-up, inject a pre-filled price book per trade (tear-off, drip edge, mowing, paver install, etc.), editable via a mobile-friendly “Smart-Book Editor.”[1]
- **Business DNA & migration filter**

    - Pocket HQ's logo, tax rates, markup, and etc. fit your `companies` + `usersettings` schema and "Price Check Game" step (ask for 2–3 critical variables like labor rate, disposal fee, and trip charge to personalize instantly).[1]
    - Your plan to ask "How do you currently run your business?" (Paper vs QuickBooks vs other software) and fork the flow (Fresh Start vs QuickBooks Client Sync vs Contact Scraper) is the deeper version of Pocket HQ's onboarding filter for new vs migrating businesses.[1]
- **Team roles & field friction removal**
    - Pocket HQ's Team Roles (Owner / Tech / Sales) line up with your RBAC plan (owner can see financials, field techs only see Today's Jobs + Clock In + Photos).[1]
    - Your Magic Link + Device Pairing + 4-digit PIN "Field-Pass Login System" is a direct answer to your own concern about field guys hating passwords and is more advanced than most current trade CRMs.[1]

3. Core Modules: You Already Have the Skeleton

Pocket HQ Phase 2 modules map cleanly onto the TradeLite architecture in your PDF.

- **CRM & Lead Management**
    - Pocket HQ: universal inbox, lead form → lead card, Kanban pipeline.[1]
    - TradeLite: "Lead Bucket" → simple web form + pipeline card UI; later, this can expand into a universal communication feed by attaching messages to `clients` / `jobs` records.[1]
- **Estimating & Proposals**
    - Pocket HQ: tiered "Good/Better/Best," visual line items, dynamic calculations, signatures.[1]
    - TradeLite: mobile-first Price Book with preloaded trade items, on-the-fly item save, PDF quote, one-tap "Approve" that converts Lead → Sold Job → Work Order.[1]
    - Your `lineitems` table (with `tradetag`, change-order flag) plus a dynamic quantity field already satisfies the "change sqft → recalc job" pattern.[1]
- **Scheduling & Dispatch**
    - Pocket HQ: drag-and-drop calendar, map view, job status notifications, resource allocation.[1]
    - TradeLite: Hybrid Workflow Engine that supports both Project Mode and Route Mode; route management for recurring services and a simple calendar tied to `jobs.workflowtype` (Project vs Recurring).[1]
    - Your design for "Job Card" plus map navigation + one-tap "On My Way" / "Clock In" actions is the practical mobile implementation of this.[1]
- **Job Management & Field Ops**
    - Pocket HQ: Site Profile, forced before/during/after photos, geo-fenced clock-in, change orders.[1]

    - TradeLite: `jobs` + `jobmedia` tables, required photo stages, Clock In/Out tied to job and device, and mobile change-order line items with signature capture to instantly update balance due.[1]
- **Finance & Invoicing**
    - Pocket HQ: convert estimate to invoice, mobile payments, receipt scanner, Profit Pulse.[1]
    - TradeLite: Stripe integration as core MVP, one-tap Estimate→Invoice, expenses and receipts (`expensetracking` spec), plus simple job costing via Actual vs Estimate using your Mini-PSA "Profitability Engine" pattern.[1]
- **Reputation & referrals**
    - Pocket HQ: auto review request + referral engine.[1]
    - TradeLite: follow-up automation from the "Retention Automation" step (e.g., 3-day post-job SMS for reviews; 6-month maintenance reminder), which can later plug into the "Review Resurrection Bot" mechanism from your Profit Spy research.[1]

4. Mobile-First "Secret Weapons" You Already Designed

Pocket HQ Phase 3 (Offline, Voice, Morning Briefing) is fully compatible with your local-first, AI-accelerated stack.

- **Offline / Sync-Later**
    - You explicitly chose WatermelonDB/SQLite + background sync with Supabase for a local-first architecture, enabling offline creation of jobs, photos, and clock-ins with optimistic UI and queued sync.[1]
    - This is exactly the "basement / rural" solution Pocket HQ calls for and a major differentiator versus cloud-only web apps.[1]
- **Voice-to-Data**
    - Pocket HQ's voice note → materials automation matches your broader "AI-First/Vibe Coding" approach: voice note to structured job notes, auto-add materials to the job or price book using serverless functions.[1]
    - This taps into your research on AI agents "doing" work, not just answering questions.[1]
- **Morning Briefing**
    - Pocket HQ's 6:30 AM push summarizing the day is a straightforward notification built on your Mini-PSA metrics: jobs scheduled, route starts, outstanding balances, and overdue invoices, all already modeled in your database design.[1]

5. Strategic Positioning and Go-To-Market

Your Zero-to-Flip and IPA v2.0 research gives a concrete business strategy for this app, beyond the feature set.[1]

- **Niche + vertical-first**
  - You can launch Pocket HQ as "TradeLite for Roofers" or a specific combo (Landscaping + Masonry) first, using the Service Stack Onboarding to quietly support others later.[1]
- **Onboarding = anti-churn moat**
  - You correctly identified that churn in B2B software happens in the first 10 minutes if onboarding feels like a week-long project; your wizard, pre-filled templates, Magic Link logins, and migration filters directly attack that.[1]
- **Pricing & flipping**
  - The Mini-PSA section recommends tiered pricing and a 90-day MVP to revenue, while your indie hacker blueprint suggests AppSumo LTDs and eventual flipping on Acquire.com once MRR is stable.[1]
  - Pocket HQ's broad scope is compatible with starting very narrow (one trade, one region), hitting 1–2k MRR, then iterating or exiting.[1]

If helpful, the next concrete step would be to translate this combined outline into a short, implementation-ready Product Requirements Document specifically for "Pocket HQ v0.1 for Roofers," using your existing React Native + Supabase stack and the onboarding wizard as the centerpiece.
